## ABOUT THE FUND

- Baroda BNP Paribas Low Duration Fund invests in fixed income instruments such that Macaulay duration of scheme is between 6 - 12 months.
- The short maturity profile of the fund helps to reduce the sensitivity of the portfolio to changing interest rate scenarios.
- The scheme aims to invest in a prudent mix of debt securities, money market instruments and government securities to generate capital appreciation. The portfolio construction process follows a stringent internal credit policy framework with the endeavor to invest in papers of high credit quality. Thus it aims to offer short maturity, high liquidity and moderate credit risk.
- The scheme is suitable for investors with investment horizon of 6-12 months to park their idle or surplus money.

## PORTFOLIO POSITIONING

- RBI has kept the policy rate unchanged at 6.50% and has cut the CRR by 50bps in 2 tranches of 25bps to support liquidity.
- The Liquidity conditions tightened significantly after the advance and GST outflow, turning into the deficit zone during the month end, we expect liquidity to remain tight in Q4FY2025. RBI is continuously managing the liquidity condition by doing Frequent VRR.
- The overnight rate tightens at month end to ~6.75% closer to MSF Rate, which may fall to 6.50% in 1st week of January after the government spending in month end, but broadly to remain tight in Q4 2025.
- We have allocated small amount in AAA PTC to enhance the YTM and to diversify portfolio.
- We intend to stay at the lower-neutral end of the mandate in terms of duration of the fund.

## Product Labelling

<sup>^</sup>Concept of Macaulay duration:  
The Macaulay Duration is a measure of a bond's sensitivity to interest rate changes. It is expressed in annual terms. It is the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price. Factors like a bond's price, maturity, coupon, yield to maturity among others impact the calculation of Macaulay duration.

Potential Risk Class (PRC) matrix*			
Credit Risk (Max)→	Relatively Low: Class A (CRV>=12)	Moderate: Class B (CRV>=10)	Relatively High: Class C (CRV<10)
Interest Rate Risk (Max)↓			
Relatively Low: Class I (MD<=1 year)		B-I	
Moderate: Class II (MD<=3 year)			
Relatively High: Class III (Any MD)			

MD=Macaulay Duration, CRV=Credit Risk Value.

The above PRC matrix denotes the maximum risk that the Scheme can take i.e. maximum interest rate risk (measured by MD of the scheme) and maximum credit risk (measured by CRV of the scheme).

## DISCLAIMERS

**† Concept of Macaulay duration** - The Macaulay Duration is a measure of a bond's sensitivity to interest rate changes. It is expressed in annual terms. It is the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price. Factors like a bond's price, maturity, coupon, yield to maturity among others impact the calculation of Macaulay duration. The Macaulay duration can be viewed as the economic balance point of a group of cash flows. Another way to interpret the statistic is that it is the weighted average number of years an investor must maintain a position in the bond until the present value of the bond's cash flows equals the amount paid for the bond. As it provides a way to estimate the effect of certain market changes on a bond's price, the investor can choose an investment that will better meet his future cash needs.
